# The Power of a Photo

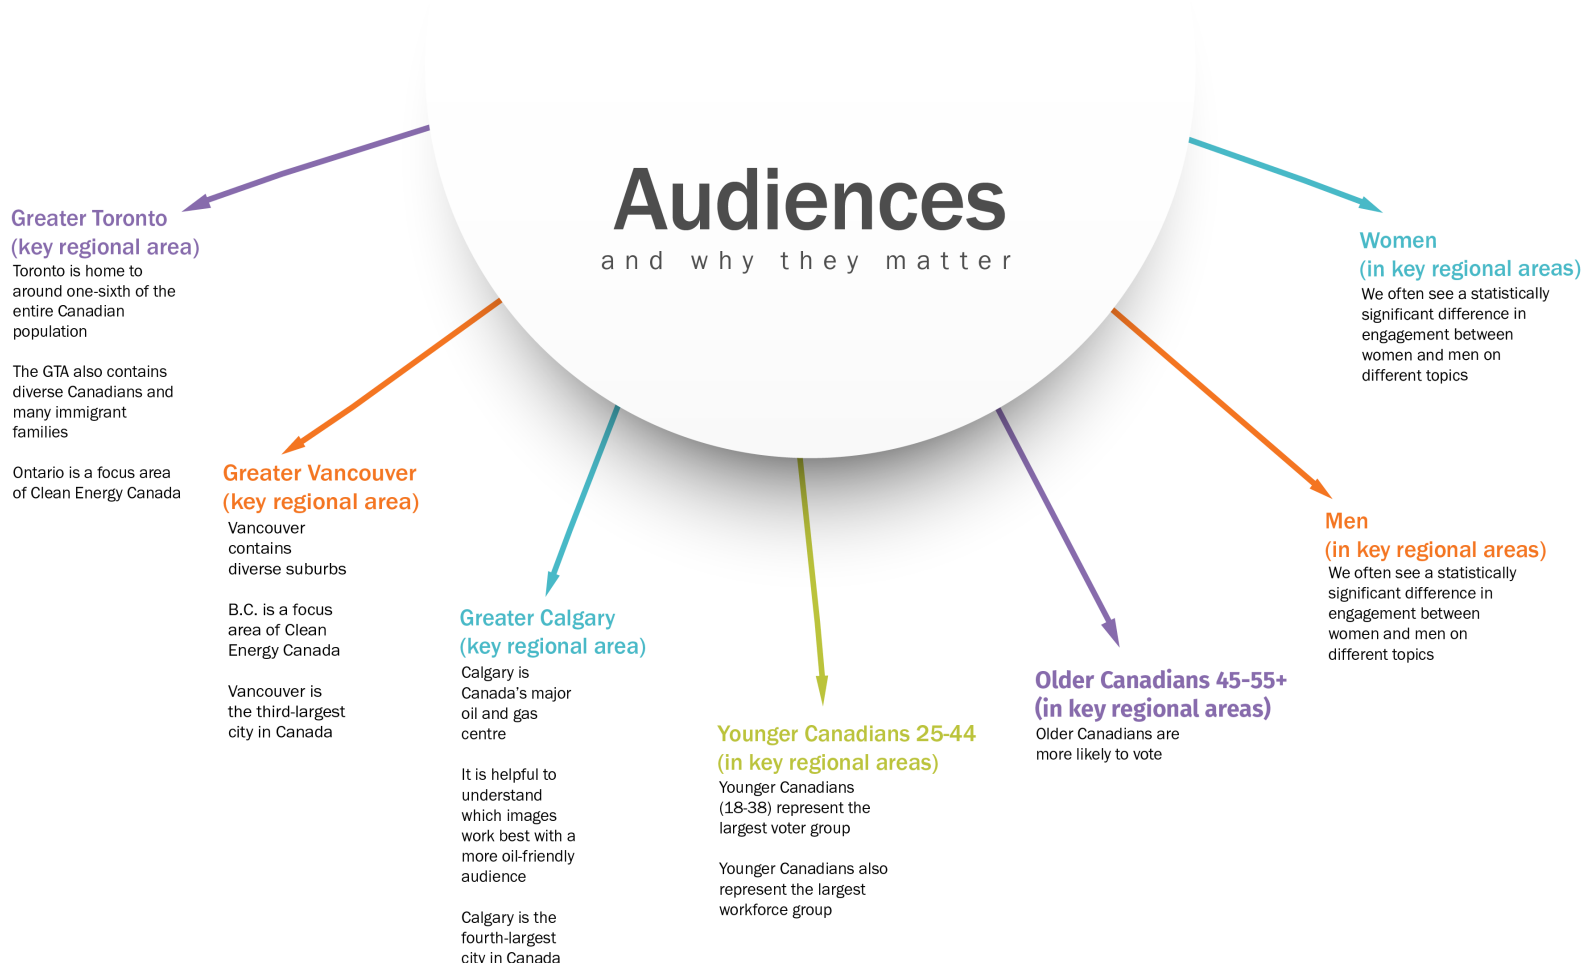

Images are a persuasive and powerful way to communicate, and creating a successful energy narrative will benefit from knowing what imagery best resonates.

The goal of this project was to determine what kinds of images are most effective at driving engagement on social media among different Canadian demographics when communicating the energy transition.

We tested in three areas—electric vehicles, the energy transition, and climate change—to determine what images were the most engaging and therefore the most cost-efficient for social media advertising. The tests were conducted in early 2020.

## Who We Tested

# Segmentation and Spending

Location	Age/Gender
Toronto	25-44, M
Vancouver	25-44, M
Calgary	25-44, M
Toronto	45+, M
Vancouver	45+, M
Calgary	45+, M
Toronto	25-44, F
Vancouver	25-44, F
Calgary	25-44, F
Toronto	45+, F
Vancouver	45+, F
Calgary	45+, F

## SPENDING ON ADS

The budget for each ad and segment was the same to ensure an equal comparison.

Duration for each test: 4 days

Test power: 80%+ (how often Facebook expects the same outcome would be repeated)

Total spend on each test category (electric vehicles, the energy transition, and climate change): \$1,728

**Total overall spend: \$5,184**

# Test 1: Electric Cars

## The Question:

Do photos that include a person perform better than a photo of just an EV?

## TAKEAWAYS

- For most male audiences, the image of a woman charging an EV performed better than the image of just an EV 5 out of 6 times.
- For most female audiences, the image of a woman charging an EV performed better than the image of just an EV 3 out of 4 times. (There was no winning ad for older and younger women in Calgary.)
- The image of an just an EV performed better with older men in Vancouver, as well as older women in Toronto.
- The image of a woman charging an EV performed better across audiences than the image of just an EV 9 out of 12 times. It's common belief that adding a human element improves engagement. This test corroborates that assumption.
- While it's clear that the photo with a woman performs better overall, and definitely among younger Canadians, it is less clear that a photo with a human element when tested among older Canadians may have returned different results had the person in the photo represented their demographic.

## THE LESSON:

**When communicating about EVs, include a person in your image to receive optimal engagement.**

Image 1: EV without a person

Image 2: EV with a woman charging

# Test 2: The Energy Transition

## The Question:

What type of energy transition image receives the most engagement: oil, wind, or solar?

## TAKEAWAYS

- The wind image was the big winner, performing best 11 out of 12 times.
- Solar consistently performed second-best, receiving the second-best engagement 9 out of 12 times.
- Oil consistently came in last place, receiving the lowest engagement among audience segments 10 out of 12 times.
- The success of the wind image may indicate that audiences prefer visually pleasing scenic landscape that tell a deeper story.

## THE LESSON

**When communicating ideas and news around the energy transition, images of wind energy may result in the highest audience engagement, and images related to oil may be the least engaging. In short, show them the clean energy future they want.**

**In terms of wind versus solar, it's unclear whether a preference for the former stems from an aesthetic preference for turbines or if wind photos simply tend to be more scenic.**

Oil .30</li> </ol> <p>Test power: 95%</p> <p>Average cost per engagement: .23</p>

# Test 3: Climate

## The Question:

What type of climate image receives the most engagement: pollution, a wildfire, or wind power?

## TAKEAWAYS

- Wind power was a clear winner, coming first place for 9 of 12 audiences.
- The wildfire came in second place, appearing as the winning image in 3 of 12 audiences.
- Pollution consistently came in last place, with the lowest engagement among audience segments. It did not appear as the image with the most engagement in any audience.
- Among younger users, the wildfire images performed as well as the wind photos (each won three tests, all of them in Western Canada), while among older users, the wind power photo won universally. This may indicate a greater openness among young Canadians to engage with urgent and negative messaging and a preference among older Canadians to engage with solutions-oriented messaging.

## THE LESSON

**When talking about climate change, picturesque images of wind farms and other clean energy landscapes will likely engage the most Canadians, while using images of pollution will not resonate with most audiences.**

**Among a few location and age segments, wildfires do resonate, and this may be connected to regional concerns regarding wildfires.**

## Conclusion

Overall, like the pictures of pollution, images related to oil were the poorest performing. When looking at the broader categories that these images represent—clean energy (wind, solar), climate change (wildfires), and fossil fuels (oil, pollution)—the fossil-fuel-related images were the clear losers across the board. Images showing the impacts of climate change may work more effectively for younger Canadians, especially if the image shows a localized impact (such as wildfires in Western Canada).

Clean-energy-related images, meanwhile, led engagement results and were the clear winners, seeing the most successful outcomes for the money invested. Anyone posting or advertising on Facebook on topics such as climate change and the energy transition should keep this in mind. In short, positivity pays off.
